

The power and torque values of the vehicle at the moment of measurement, friction losses in the driveline can be measured with the SerpAuto Dynamometer test setup for two wheel drive vehicles and the above and below ground two wheel drive dynamometer system in the laboratory. Also, faults that occur only under load can be determined by performing road simulation. The test system can be used for vehicles of different power and type.

For Gasoline, LPG, CNG and Diesel Vehicles, 2004/22 EC, TS ISO 11614, 72/306 EC and National Type Approval Certificate, Compliant with the Exhaust Gas Emission Measurements Regulation.

- Ability to auto and manual reset
- Safe measurement with double filter system
- To be able to examine the results on digital and graphic screens
- Microprocessor controlled fast and precise measurement
- NDIR Measurement Method
- Automatic reset
- 10 sec response time
